# 1 Introduction

*APSIL* or *Application Programmer's Simple Integer Language* is a simple and strongly typed programming language. The features and constructs of this language are minimal and mainly intended for testing an experimental operating system. The compiler of APSIL runs on ESIM (*Extended Simple Integer Machine*) architecture.

This document describes the syntax, semantics and constructs of APSIL in detail. The structure of APSIL is similar in many aspects to programming languages like C and Java.

## 2 General Program Structure

A typical APSIL program is orgnaized in the following way.

```
Global Declarations
.
.
Function Definitions
.
.
Main Function
```

## 3 Lexical Elements

### 3.1 Comments and White Spaces

APSIL allows only line comments. Line comments start with the character sequence `//` and stop at the end of the line. White spaces in the program including tabs, newline and horizontal spaces are ignored.

### 3.2 Keywords

The following are the reserved words in APSIL and it cannot be used as identifiers.

read	write	if	then	else	endif
while	do	endwhile	integer	string	main
return	and	or	not	decl	enddecl
begin	end	Create	Open	Write	Seek
Read	Close	Delete	Fork	Exec	Exit

### 3.3 Operators and Delimiters

The following are the operators and delimiters in APSIL

(	)	{	}	[	]	/	*	+	-	%	;
>	<	>=	<=	!=	==	and	or	not			

### 3.4 Identifiers

Identifiers are names of variables and user-defined functions. Identifiers should start with an alphabet, and may contain both alphabets and digits. Special characters are not allowed in identifiers.

```
identifier -> (alphabet)(alphabet | digit)*
```

### 3.5 Literals

There are integer literals and string literals in APSIL. An integer literal is a sequence of digits representing an integer. Negative integers are represented with a negative sign preceding the sequence of digits. Any sequence of characters enclosed within double quotes (") are considered as string literals. However APSIL restricts string literals to size of atmost 16 characters.

Examples of literals are 19, -35, "Hello World"

## 4 Data Types

### 4.1 Primitive Types

There are two primitive data types in APSIL.

1. **Integer** : An integer value can range from -32767 to +32768. An integer type variable is declared using the keyword `integer`
2. **String** A string type represents the set of string values. A string value can be atmost 16 characters long. String type variables is declared using the keyword `string`.
